SPERGER

The new outstanding seed treatment by dusting for the prevention of seed born diseases and fungi causing low germination of seed. It is non-poisonous and does not harm the seed under any conditions of soil, moisture or temperature, according to results to date. It can be used for all kinds of seed. You will be pleased and surprised with the results.

DEAR CUSTOMER:

We are describing below Regular Sudan and Sweet Sudan, which we are sure will be of interest to you.

SUDAN GRASS
Sorghums for Grazing

SUDAN GRASS,

An annual, drought-resistant, quick growing and very nutritious sorghum for pasture and hay, introduced from Africa in 1909 by the U. S. Department of Agriculture. Sudan has now become the most valuable and widely distributed and adaptable of all the summer annual grass crops used for green grazing in the central and southern states. Grows well on almost any soil, except deep sand in high rainfall belts. May be planted several times during the long southern growing season to provide continuous green succulent growth. Readily grazed by all classes of livestock and ready to pasture in 4-6 weeks after planting when it has attained a height of 2-3 feet. Frequently used to plow under as a green manure crop. Finds a place as a soil-control crop to afford protection from wind and water erosion. Plants grow 5 to 6 feet tall, erect, with numerous, fine, leafy, stems. Root system fine, fibrous, spreading.

SWEET SUDAN GRASS,

A new and distinct grass sorghum developed by the Texas Agricultural Experiment Station through crossing Sudan grass and Leoti sorgho and repeatedly back-crossing to the Sudan grass parent. Sweet and juicy stalk, non-shattering seed habit, a distinct sienna colored seed and disease resistance have been transferred from the sorgho to the new grass sorghum through plant breeding. Resembling common Sudan in plant habit, Sweet Sudan is a little later in maturity, more vigorous growing and a higher yielder of both forage and seed. The plants are sweet and juicy, more resistant to foliage diseases and chinch bugs than common Sudan, and remain green and growing later in the summer and fall. Bright reddish seed hulls readily distinguish the variety from common Sudan, livestock prefer Sweet Sudan to common Sudan, the grazing period of the pasture is extended and the coarse stems are eaten readily.

We are looking forward to supplying you with your requirements of field seed.

With best regards, we are

Yours very truly,

Associated Seeds, Inc
